

Deep Dive in Packet Analysis - Using Wireshark and Network Miner

OBJECTIVE:

CompTIA Security+ Domain:

Domain 3: Threats and Vulnerabilities

CompTIA Security+ Objective Mapping:

Objective 3.7: Given a scenario, use appropriate tools and techniques to discover security threats and vulnerabilities.

OVERVIEW:

Packet Analysis is the process of sifting through network traffic and finding relevant artifacts. Analyzing network traffic is critical to the protection of information systems.

OUTCOMES:

In this lab, you will learn to:

1. Use Wireshark to view protocol traffic.
2. View protocols using Wireshark.
3. Parse objects from network traffic.
4. Use NetworkMiner.

Key Term Description

FTP	File Transfer Protocol is a clear text protocol used to transfer files between systems.
TELNET	TELNET is a clear text protocol that is used to remotely administer a machine.
ping	uses internet control message protocol to check for connectivity between two systems
SSH	Secure shell is used to securely transfer files between two systems.
DNS	The Domain Name System converts IP addresses to names and names to IP addresses.

Reading Assignment

Introduction

Packet analysis is the process of sifting through network traffic and finding relevant artifacts. Analyzing network traffic is critical to the protection of information systems. Figure 1 shows the lab topology for this lab. You will be using a pcap file with previously captured network activity in Wireshark to explore that

network traffic.

Windows 8.1 Attack Machine

FIGURE 1 - LAB TOPOLOGY

Overview of TCP/IP

Recall, the Transmission Control Protocol/Internet Protocol (TCP/IP) networking model consists of four layers: application, transport, network, and data link. Figure 2 shows the different TCP/IP layers. Services run at the application layer and interact with the transport layer using ports. Port numbers are assigned to different services on the operation system. Services, such as File Transfer Protocol (FTP), Telnet, Hypertext Transport Protocol (HTTP), and others, use unique port numbers assigned to them by the operating system. FTP has a port number of 21, Telnet uses the port number of 23, and HTTP has a port number of 80. Port numbers are assigned to a particular protocol and service by the operating system. These port numbers are how TCP/IP knows how to communicate from the transport layer to the application layer. TCP/IP was not initially designed with security in mind so these applications are configured by default to send traffic over the network in plaintext. There are newer services that use encryption like Secure Shell (SSH) and Hypertext Transport Protocol Secure (HTTPS) that are used in place of these older, less secure protocols.

Application (FTP, Telnet, HTTP, etc.)
Transport (TCP/UDP)
Network (IP)
Data Link

FIGURE 2 - TCP/IP NETWORKING MODEL

There are several protocols used in this lab which will have an image of the header format to assist in analyzing network traffic when you are using Wireshark.

Address Resolution Protocol (ARP)

ARP is a protocol used for discovering Media Access Control (MAC) addresses associated with an IP address. When the TCP/IP stack uses ARP to determine the MAC address for an Internet Protocol (IP) address, the mappings are stored in an ARP cache and can be manipulated with the arp command. (Note: arp is both a protocol as well as a command).

Hardware Type (16 bits)		Protocol Type (16 bits)
HA Length (8 bits)	PA Length (8 bits)	Operation (16 bits)
Sender Hardware Address (Octets 0-3)		
Sender Hardware Address (Octets 4-5)		Sender Protocol Address (Octets 0-1)
Sender Protocol Address (Octets 2-3)		Target Hardware Address (Octets 0-1)
Target Hardware Address (Octets 2-5)		
Target Protocol Address (Octets 0-3)		

FIGURE 3 - ARP PROTOCOL (SOURCE: ARP)

Internet Protocol (IP)

IP is a connectionless network layer protocol that transmits packets from a source host to a destination host. It uses a 32-bit address space and usually represented in decimal dotted notation (192.153.10.1). One of the functions of the IP protocol is a routing function that allows for communications between hosts on a local area network (LAN) and a wide area network (WAN). The successor to IP is IPv6. Figure 4 shows the IP protocol.

IP Header

FIGURE 4 - IP PROTOCOL (SOURCE: IP)

Internet Protocol (IPV6)

IPv6 is the successor to IP, which is also known as IPv4. It is an upgrade to IPv4 to allow for more

addressing, and its addresses include both numbers and hexadecimal letters. IPv6 also allows for a much larger 128-bit address space. Notice the difference in the size of the IP address. Figure 5 shows IPv6 protocol.

FIGURE 5 - IPV6 (SOURCE: IPV6)

Internet Control Message Protocol (ICMP)

ICMP is a supporting protocol. ICMP is typically used with the ping and traceroute (tracert in Linux) commands. It allows network devices to send error messages and other diagnostic information. Figure 6 shows the ICMP protocol.

FIGURE 6 - ICMP PROTOCOL (SOURCE: ICMP)

Transport Control Protocol (TCP)

TCP is a protocol that sits at the transport layer of the TCP/IP stack. It is a reliable, ordered, connection oriented, and error checked. TCP's job is to make sure that a connection is created between the source and destination host and reliably send packets over the network. TCP works in three phases: connection setup, data transmission, and connection termination. Port numbers are assigned to particular application layer protocols to allow for applications to talk to each other from source to destination. Figure 7 shows the TCP protocol.

FIGURE 7 - TCP PROTOCOL (SOURCE: TCP)

User Datagram Protocol (UDP)

UDP is a protocol that sits at the transport layer of the TCP/IP stack. It is a connectionless protocol. It provides minimal error checking unlike TCP. It also allows for port numbers to communicate with application layer protocols. Figure 8 shows the UDP protocol.

FIGURE 8 - UDP PROTOCOL (SOURCE: UDP)

File Transfer Protocol (FTP) (Port 20/21)

FTP, which uses TCP, is a protocol that allows for transfer of files between systems and runs on top of TCP. The different layers and protocols that run FTP are shown in Figure 9. All data and credentials are transmitted over the network in clear text. It is a very insecure protocol. FTP can be secured in different ways using the Secure Sockets Layer (SSL) as one example, but Secure Copy (SCP) can be used as the secure alternative also and it is easier to configure because it comes with SSH. In this lab, the Kali machine will act as the FTP client and the Windows Server will host the FTP server.

Application	FTP
Transport	TCP
Network	IP
Data Link	Ethernet

FIGURE 9 - FTP PROTOCOL STACK

Post Office Protocol (POP3) (Port 110)

POP3, which uses TCP, is an application layer protocol that provides a way for users to read e-mail from an e-mail server. Figure 10 shows the protocol stack for POP.

Application	POP
Transport	TCP
Network	IP
Data Link	Ethernet

FIGURE 10 - POP PROTOCOL STACK

Simple Mail Transfer Protocol (SMTP)

SMTP, which uses TCP, is an application layer protocol that provides a way for users to send e-mail from an e-mail server. Figure 11 shows the protocol stack for SMTP.

Application	SMTP
Transport	TCP
Network	IP
Data Link	Ethernet

FIGURE 11 - SMTP PROTOCOL STACK

Domain Name System (DNS)

DNS, which uses UDP and TCP, is a hierarchical naming system for network devices on a network called a domain. DNS uses UDP for lookups and TCP for zone transfers. Each network device can have a domain name associated with it. DNS allows for translation between a fully qualified domain name (F.Q.D.N) and an IP address on a network. Users will use the domain name at the application layer, and the TCP/IP translates that into an IP address to be transmitted onto a network.

FIGURE 12 - DNS PROTOCOL (SOURCE: DNS)

Figure 13 shows the protocol stack for DNS.

Application	DNS
Transport	UDP

Network	IP
Data Link	Ethernet

FIGURE 13 - DNS PROTOCOL STACK

Examining Protocol Traffic in Wireshark

Wireshark is a network protocol analyzer. It allows you to inspect and capture packets on your network. It allows you to inspect the traffic that is transmitting on your network.

The format for a packet that is transmitted over a network usually looks like in Figure 14.

FIGURE 14 - PACKET FORMAT

This relates to the layers in the TCP/IP protocol stack. Media Access Control (MAC) header is Ethernet, Internet Protocol (IP) header is the network/Internet layer, TCP header is the transport layer, and the message is the application layer. When a message is transmitted over the network, it encapsulates the header from each of the layers before it transmits onto the network. When the message is received, the headers are stripped off as it works its way up the protocol stack to the application. Figure 15 illustrates how a message flows from the client to the server.

FIGURE 15 - MESSAGE FLOW FROM CLIENT TO SERVER AND BACK

Wireshark provides a user interface that allows you to filter your network traffic and analyze that traffic. A system administrator can use Wireshark if he or she suspects there might be nefarious traffic that the firewall and intrusion detection system is not detecting. A system administrator needs to know the protocols in depth to grasp the information being transmitted on the network. Figure 16 shows the user interface for Wireshark. You open a captured network traffic file and the first step is to filter the traffic which is called a DisplayFilter.

A DisplayFilter allows you to only see traffic that you want to see. You can filter on items like the `tcp.port` number, the protocol type, IP addresses, etc. For more information on DisplayFilter, see this [link](#). To fully

appreciate the details of the headers of the different protocols at the different layers, you need to review the header information. Wikipedia is a good source of header information for the different protocols used on a network. Once the filter is set, the results appear in #2. As you change the DisplayFilter, you can zero in on what you want to see. When you click on a packet, the packet info appears in #3. Details about the selected link is in the second part of the window. You can examine the details of that particular part of the captured data. The #4 of the screenshot shows the file in hexadecimal format on the left side of the pane.

FIGURE 16 - WIRESHARK INTERFACE

Network Miner

Network miner is Network Forensic Analysis tool (NFAT) that runs on Windows, Linux, MacOS X, and FreeBSD. It can be used as a passive packet sniffer or a network analysis tools using PCAP files. Network Miner can extract images, files, e-mails, certificates, credentials, cookies, passwords, and others artifacts using a PCAP file or by directly sniffing network traffic. Figure 17 shows the user interface for Network Miner.

FIGURE 17 - NETWORK MINER INTERFACE (SOURCE: NETWORKMINER)

CONCLUSION:

In this lab, you will be using Wireshark to analyze different protocols at different layers. You will also use Network Miner to extract images and files.

Viewing Protocols With Wireshark

1. Click on the external Windows 8.1 icon on the topology.

Windows 8.1 Attack Machine

WINDOWS 8.1 MACHINE

2. **Double-click** on the `lab11.pcap` Wireshark file in the list.

CAPTURE FILE

3. **Type** `ipv6` in the Wireshark filter pane and then **click** `Apply` to view `IPv6` traffic.

WIRESHARK FILTER

18. **Read** the plain text credentials. **Click** the **Close** button to close the **TCP Stream**.

WIRESHARK FILTER

19. Type `tcp.port == 19` in the Wireshark filter pane and then click **Apply** to view CHARGEN traffic. Right-click on the first frame and select **Follow TCP Stream**.

WIRESHARK FILTER

20. **Read** the generated characters. **Click** the Close button to close the TCP Stream.

TCP STREAM CONTENT

21. Type `tcp.port == 13` in the Wireshark filter pane and then click **Apply** to view **DAYTIME** traffic. Right-click on the first frame and select **Follow TCP Stream**.

WIRESHARK FILTER

22. **Read** the date and time. **Click** the **Close** button to close the **TCP Stream**.

WIRESHARK FILTER

23. Type **tcp.port == 7** in the Wireshark filter pane and then **click** **Apply** to view **ECHO** traffic. **Right-click** on the first frame and **select** **Follow TCP Stream**.

FOLLOW TCP STREAM

24. **Read** the doubled characters. **Click** the **Close** button to close the **TCP Stream**.

TCP STREAM CONTENT

25. Type **ssh** in the Wireshark filter pane and then **click Apply** to view **secure shell traffic**.

SAVE ALL

3. For the folder name, type **lab11**. Click **OK**.

WIRESHARK

4. Click **OK** to the message that **some files cannot be saved**.

WIRESHARK

5. Close the **HTTP object list** and **Wireshark** by **clicking** the two **Xs** in the top right corner.

CLOSE THESE WINDOWS

6. **Double-click** on the newly created **lab11** folder on your desktop.

PARSSED FILES

7. **Right-click** in the white space and **select** **View** and **Medium icons**.

PARSSED FILES

8. **Find** a **picture icon** and **double-click** on it. Then **Close** the **picture file** and the **lab11** folder.

PARSSED FILES

9. Double-click on the **flags.pcap** Wireshark file in the list.

10. Type **tcp.port == 17** in the Wireshark filter pane and then **click Apply** to view QOTD traffic. Right-click the first frame and then **select Follow TCP Stream**.

WIRESHARK FILTER

11. **Read** the Quote of the Day. **Click** the Close button to **close** the TCP Stream.

TCP STREAM CONTENT

12. **Notice** the flag of 999818. **Click** on the Challenge icon and **type** the flag number into the left hand pane in the field for **flag#1answer** box. This is just to show you how to **capture** Challenge Flags you will see throughout this lab.

Challenge Sample #

Challenge #

Challenge #

Challenge #

DISCUSSION QUESTIONS:

1. What is HTTP?
2. What is the port of QOTD?

Using Network Miner

1. **Double-click** on the **shortcut** to NetworkMiner on your desktop.

NETWORKMINER

2. **Drag** the **lab11.pcap** file into the **NetworkMiner** window.

NETWORK MINER

3. **Wait** for the **lab11.pcap** file to fully transfer. Then **click** on the **Hosts** tab and **view** the hosts running the **Microsoft operating systems**.

NetworkMiner 1.6.1
